No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, a derived by analysis of the total score distribution. score gand is Pred.

especially explosives comprises Apparatus for detecting small molecules, a piezoelectric crystal.

Disclosure, Fig 3A; 90pp; English

The present sequence is the heavy chain variable region of 583 antibody. The cDNA encoding this sequence was obtained from total RNA extracted from a 583 hybridoma by RT-PCR. 583 is an IgG1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for detecting small assayed explosive molecules. Molecules are detected using a piezoelectric sensor. Piezoelectric immunoassaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight molecules

b 5D5, mAb diagnosing, for competes with 6C12, useful that s and peptide t both 5D5 cancer nin-5 gamma2-binding cross-competes with or preventing laminin-5 treating,

English 338pp; 96; ID NO Disclosure;

The invention relates to a peptide that competes with mab 5D5, mab 6C12, or cross-competes with both 5D5 and 6C12 in specifically binding to at least a portion of domain III of the gamma2 chain of human laminin-5 (Ln-5 gamma2 DIII). Also included are a composition comprising an amount of the isolated peptide and a pharmaceutical carrier, an assay for assessing the gamma2-associated peptide content of a composition (comprising administering the peptide to the composition and determining whether the peptide binds any gamma2-associated peptides in the composition), a method of reducing cancer progression in a patient and a method of treating cancer in a patient. The peptide is a monoclonal antibody, preferably a humanized antibody or a fully human antibody. It binds a protein that is secreted from human cancer cells and comprises at least a portion of Ln-5 gamma2 DIII. The peptide is also conjugated to a compound the nucleic acid, and the composition are useful in the preparation of a medicament for the treatment of cancer. The peptides, nucleic acids, and the composition are useful for diagnosing, treating, or preventing cancer. The present sequence represents a Anti-laminin-5 gamma2 antibody heavy chain. t least a compound

The invention relates to an antibody or its fragment, capable of recognizing and binding to a three-dimensional structure of an extracellular region of a polypeptide encoded by a p53 apoptosis effector related to PMP-22 (PERP) gene. The invention also relates to a hybridoma that produces the antibody, a DNA encoding the antibody, a recombinant vector comprising the DNA, a host cell obtained by transducing the vector to the host cell, a method of producing the antibody and a therapeutic agent comprising the antibody as an active ingredient. The antibody is useful in an immunoassay for measuring the polypeptide encoded by the PERP gene, in the cell. The immunoassay is immunoprecipitation. The antibody is useful for measuring the expression of a polypeptide encoded by the PERP gene, using a fluorescent cell staining technique. The antibody is useful as a reagent for detecting the polypeptide encoded by the PERP gene and for diagnosing the disease associated with a

Novel antibody capable of binding to three-dimensional structure of extracellular region of polypeptide encoded by p53 apoptosis effector related to PMP-22 gene, useful for manufacturing diagnostic and therapeutic agent for cancer.

polypeptide encoded by the PERP gene. The disease is cancer. The antibous useful in diagnosing a disease by detecting or measuring the amount a polypeptide encoded by the PERP gene in a cell, for treating cancer, for manufacturing a diagnostic, for detecting cancer and for manufacturing a therapeutic agent for cancer. This sequence represents murine PERP related protein of the invention. Note: The sequence data this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

         Monoclonal antibodies which inhibit type II phospholipase A2 are useful in the treatment of myocardial infarction, cerebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, pancreatitis, adult respiratory distress syndrome and colitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma P3U1 (P3x63Ag8.U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12H5, 1.4 and 10.1. These were cultured and the antibody isolated from the culture supernatant by precipitation with ammonium sulphate and purification on a column of protein A-Sepharose CL4B. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is particularly suitable for preclinical testing
                                                                                                                                                                                                                                     ^{\circ}

disorders (such as acute renal failure) associated with the
administration of cisplatin for the treatment of cancer. The method
comprises treatment with a monoclonal antibody which inhibits the
activity of type II phospholipase A2 (particularly of type II
phospholipase A2 of human origin), or with a protein or peptide
possessing the same inhibitory activity and containing a part of the
antibody sequence. Preferably the antibody also inhibits the activity of
antibody sequence. Preferably the antibody also inhibits the activity of
cype II phospholipase A2 bound to a cell membrane. Three specific
cype II phospholipase A2 bound to a cell membrane. Three specific
monoclonal antibodies having these properties which can be used are 12H5,
C 10.1 and 1.4, derived from hybridomas FERM BP-5300, FERM BP-5298 and FERM
C BP-5297 respectively. The method can be used for suppressing the
c nephrotoxicity which is a characteristic feature of cisplatin
c administration, and therefore allowing more efficient use of this drug as
c an anticancer agent, e.g. by allowing an increased dosage to be used

                                                  The sequences given in AAR28670-71 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL-6R). The antibody comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma PM1 which contained the plasmids pPM-k3 and pPM-h1. The invention relates to an isolated specific binding member (I) which recognizes an epidermal growth factor receptor (EGFR) epitope which is found in tumourigenic, hyperproliferative or abnormal cells and not detectable in normal cells. The EGFR epitope is located within the region comprising residues 273-501 of EGFR and does not demonstrate any amino acid sequence alterations or substitutions from normal EGFR. (I) is capable of binding the de2-7 EGFR and absence of amplification of junctional peptide and does not bind to EGFR on normal EGFR. (I) is absence of aberrant expression, or in the absence of amplification of normal wild-type gene. The binding member comprises the VH and VL polypeptide sequence of monoclonal antibody (mAb) 806. (I) is useful for treating or diagnosing human or animal body, especially for treating treating or diagnosing human or animal body, especially for treating treating or treating cancer which is located in or adjacent the brain, in a mammal. (I) is useful for the preparation of amedicament and for preventing or treating cancer which is located in or adjacent the brain, in a mammal. (I) is also useful for detecting the presence of amplified EGFR, de2-7EGFR or EGFR with high mannose glycosylation, where the presence of amplified EGFR, de2-7EGFR or EGFR with a high mannose glycosylation of suspicing a biological sample from a mammal in which the presence of amplified EGFR from the sample and the antibody, where the detecting the presence or activity of an EGFR which indicates the expression of binding indicates that presence or activity of the EGFR will be amplified EGFR from the mammal. A pharmaceutical expression or concer in the mammal. A pharmaceutical expression or concer in the mammal and optionally vehicle, carrier or dilluent is composition composition or proper in the mammal of account or definite and optionally vehicles.
                                                              cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful for preventing and/or treating cancer in mammals, especially for treating brain-resident cancers that produce aberrantly expressed EGFR mammals, such as glioblastoma, medulloblastoma, meningioma, neoplastic astrocytoma or neoplastic arteriovenous malformations, and malignant neural tumours in mammals. The present sequence represents the mAb 806
             particularly antibodies recognizing repitope found only in tumorigenic ag and treating cancer in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           f (I), and optionally ve

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                              having agonist colored ligand (preferably an antibody) (I) having agonist activity with respect to a variant receptor. A ligand of the invention has antidiabetic, haemostatic, and endocrine-gen. activity. The ligand is useful for treating the disease caused due to variant receptor, which involves combining the ligand/antibody with the variant receptor, where the disease is congenital non-megakaryocyte thrombocytopenia. A ligand of the invention is useful for transmitting signal to a variant receptor, which involves combining the variant receptor with the ligand. The invention is useful for treating diseases resulting due to variation receptor, such as type II diabetes and laron syndrome. The ligand enables signal transduction function of thrombopoietin, with respect to variant receptor. The present sequence i used in the exemplification of the invention.
                                                                                                                                                                                                          Novel ligand having agonist activity with respect to variant receptor e.g., variant thrombopoietin receptor, useful for treating disease resulting due to variant receptor such as congenital non-megakaryocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       115
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                    The invention relates to a novel ligand (preferably an antibody) (I) having agonist activity with respect to a variant receptor. A ligand of the invention has antidiabetic, haemostatic, and endocrine-gen. activity. The ligand is useful for treating the disease caused due to variant receptor, which involves combining the ligand/antibody with the variant receptor, where the disease is congenital non-megakaryocyte thrombocytopenia. A ligand of the invention is useful for transmitting signal to a variant receptor, which involves combining the variant receptor with the ligand. The invention is useful for treating diseases resulting due to variation receptor, such as type II diabetes and laron syndrome. The ligand enables signal transduction function of thrombopoietin, with respect to variant receptor. The present sequence i used in the exemplification of the invention.
                                                                                                                                                    Novel ligand having agonist activity with respect to variant receptor e.g., variant thrombopoietin receptor, useful for treating disease resulting due to variant receptor such as congenital non-megakaryocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MRVLILLWLFTAFPGILSDVQLQESGPGLVKPSQSLSLTCSVTGYSITSGYAWNWIRQFP

                                                                                                                                                                                     which specification describes a monoclonal antibody, designated anti-C3-2, which specifically binds on a functional domain exposed on native human C3, thus inhibiting the generation of the biologically active peptides such as C3a and C5a. The functional domain is in part located on the 23 kD-a-chain fragment of C3c. The antibody is useful for the preparation of a medicament for inhibiting complement activation, preferably for preventing or treating inflammatory diseases mediated by activation of complement. The present sequence represents the consensus sequence of the heavy chain variable region of the monoclonal antibody anti-C3-2, derive from N-terminal sequencing, primer-induced sequence and sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ansduction pathway; determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a monoclonal antibody, designated anti-C3-2, which specifically binds on a functional domain exposed on native human C3, thus inhibiting the generation of the biologically active peptides such as C3a and C5a. The functional domain is in part located on the 23 kD-a-chain fragment of C3c. The antibody is useful for the preparation of a medicament for inhibiting complement activation, preferably for preventing or treating inflammatory diseases mediated by activation of complement. The present sequence represents the heavy chain region of the monoclonal antibody anti-C3-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine chinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with chese receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.

The invention relates to a novel isolated anti-insulin-like growth factor capable of pinding to human IGF-IR and, if necessary, capable of capable of binding to human IGF-IR and, if necessary, capable of expectically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADSG-7006 and ADSG-7014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal appearation of the IGF-IR and/or connected with a hyperactivation of the transduction pathway of the signal mediated by the induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2. dependent and/or HERZ/neu-dependent and/or EGF-dependent and/or HERZ/neu-dependent cells. (I) is useful for preparation of a medicament intended to inhibit the growth and/or the projected prevention of tumor cells, preferably IGF-dependent and/or IGF2 dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent cells. (I) is useful in the preparation of a medicament intended for the prevention or for the treatment of psoriasis. (I) is useful in the preparation of a medicament intended for the prevention of a medicament intended for the specific targeting of encorer, osteosarcoma, lump cancer, the cancer, endometrial cancer or colon cancer. (I) is useful in the preparation of a medicament intended for the specific targeting the prevention of a medicament intended for the specific targeting the prevention of a medicament intended for the specific targeting the prevention or for the treatment of psoriasis of intended for the pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               biological sample in which the abnormal presence, of receptor is suspected, which involves contacting the ple with (I), which is optionally labeled. The presented in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                     novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or an underexpression of the IGF-IR and/a biological sample in which the abnormal

IGF

K,

Beck

The invention relates to a novel humanized anti-insulin like growth factor I receptor (IGF-IR) antibody (Ia), anti-insulin/IGF-5 hybrid receptor (hybrid-R) antibody (Ib), or anti-IGF-IR and hybrid-R antibody (Ic) or their antigen-binding fragments, comprising a complementary determining region of non-human origin and a framework region having a human residue, and capable of inhibiting in vivo tumor growth. A composition of the invention has cytostatic activity. An antibody of the invention is useful for determining regression progression or onset of a activation of human IGF-IR, hybrid-R or both IGF-IR and hybrid-R relative to normal. A pharmaceutical composition of the invention is useful for the treatment or prevention of a disorder chosen from breast cancer, chosen cancer, kidney cancer, thyroid cancer, osteosarcoma, panciestic cancer, and myeloma. The cancer, kidney and myeloma. The n isolated from region lung cancer, bla a, pancreatic can chain variable equence represents a heavy 7010 cancer, thyroid cancer, present sequence antibody monoclonal

receptor ce, of IGF-

Ig heavy chain V region - mouse
C; Species: Mus musculus (house mouse)
C; Date: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_C; Accession: S37200
R; Fischer, R.; Voss, A.; Hunziker, W.; Stierhof, Y.D.; Kr submitted to the EMBL Data Library, August 1993
A; Description: Production and cloning of TMV-specific mon A; Reference number: S37200
A; Reference number: S37200
A; Accession: S37200
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-121 <FIS>
A; Cross-references: UNIPARC: UPI00001161AC; EMBL: X74587; N C; Superfamily: immunoglobulin V region; immunoglobulin horizoners immunoglobulin homology <IMM>

Sequence 11, Application US/08913555
Patent No. 6946255
GENERAL INFORMATION:
APPLICANT: KAYAGAKI, No. 6946255uhiko
APPLICANT: YAGITA, Kideo
APPLICANT: OKUMURA, Ko
APPLICANT: OKUMURA, MOLOMI
TITLE OF INVENTION: MONOCLONAL ANTIBODY SPECIFICALLY
TITLE OF INVENTION: REACTING WITH FAB LIGAND AND PRODUCTION PROCESS
NUMBER OF SEQUENCES: 31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4.
